## Study Population

### Inclusion criteria:

- Progressive CKD
- eGFR 10–15 mL/min/1.73m<sup>2</sup>
- ≥18 yrs

### Exclusion criteria:

- Planned KT from living donor next 12 months
- Recent cancer diagnosis
- Inability to provide informed consent

2,982  
screenings

828 randomisations

- Early Start 10–14 mL/min/1.73m<sup>2</sup>  
N=404 (383 started dialysis)

- Late Start 5–7 mL/min/1.73m<sup>2</sup>  
N=424 (386 started dialysis)

July 2000

November 2008

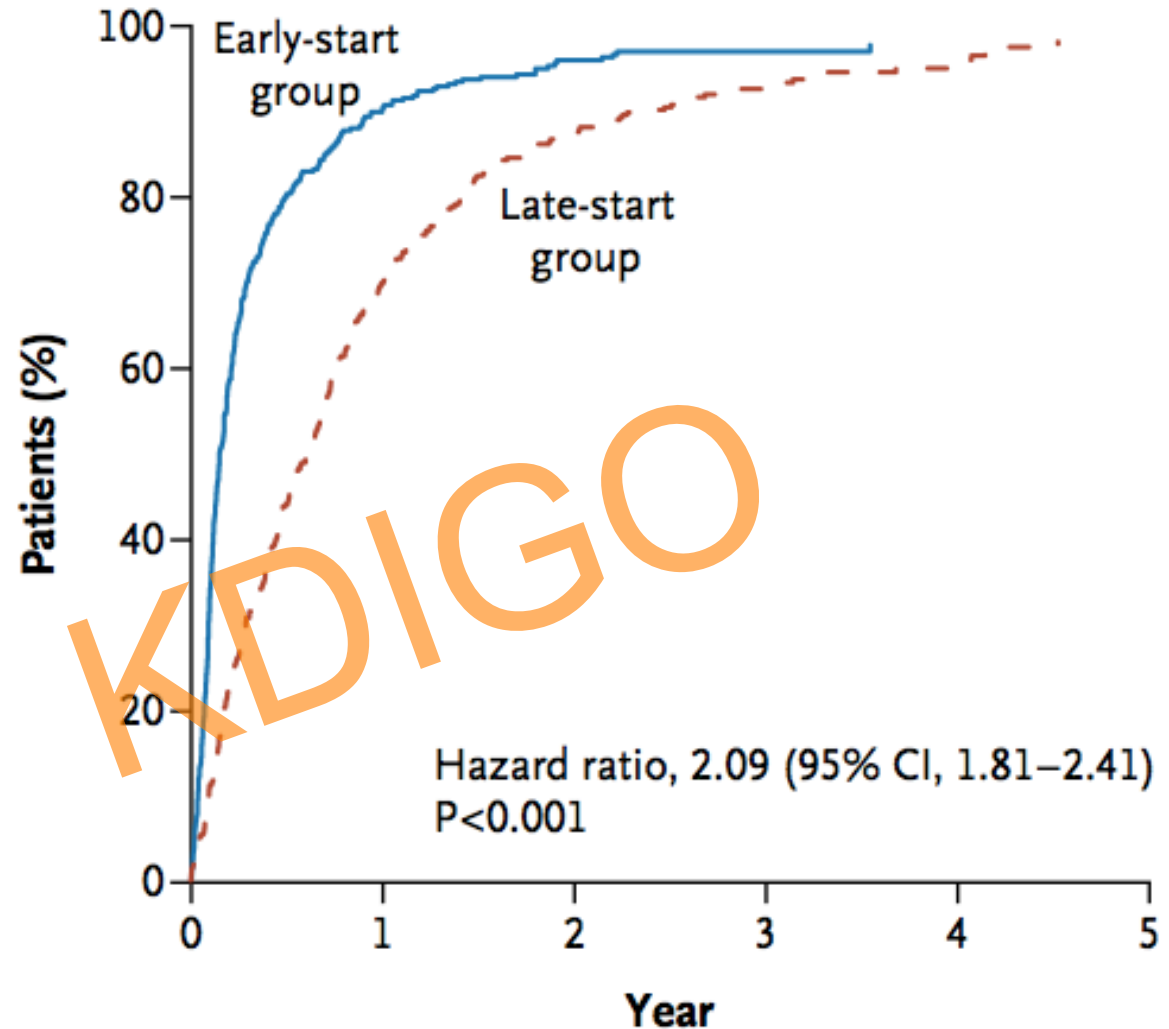

November 2009

randomisations

Median follow-up period of 3.59 years

## Time to Start of Dialysis

32 centres  
828 participants  
Median f/u 3.59 yrs

### No. at Risk

Early start	404	35	12	8	2	1
Late start	424	118	45	21	9	3

## Time to Death

### No. at Risk

Early start	404	358	305	249	177	99	59	32
Late start	424	385	333	254	187	115	60	32

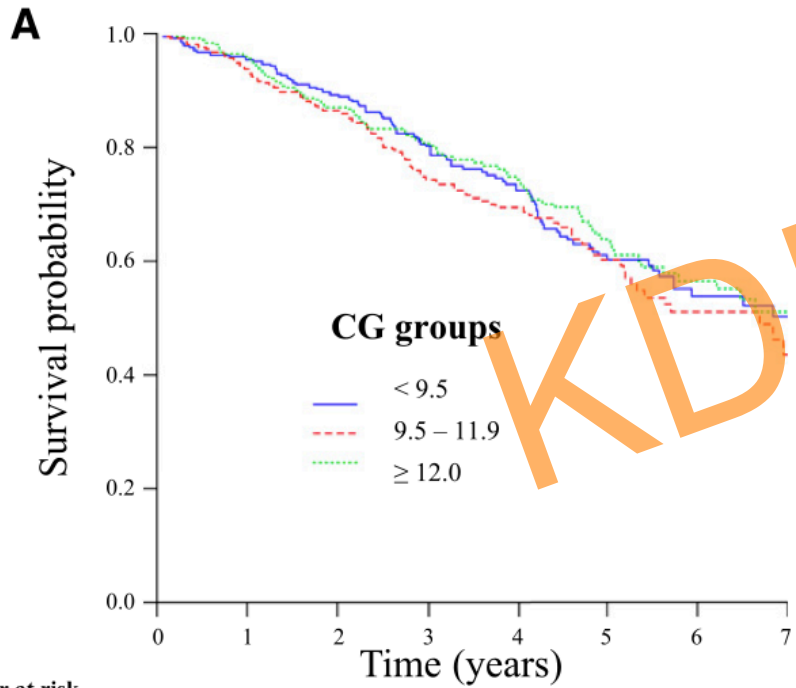

# Summary of secondary outcomes

Outcome	Early-Start Group (N = 404)		Late-Start Group (N = 424)		Hazard Ratio with Early Start (95% CI)	P Value
	No. of Events	No. of Events/ 100 Patient-Yr	No. of Events	No. of Events/ 100 Patient-Yr		
Primary outcome: death from any cause	152	10.2	155	9.8	1.04 (0.83–1.30)	0.75
Secondary outcomes						
Composite cardiovascular events	139	10.9	127	8.8	1.23 (0.97–1.56)	0.09
Cardiovascular death	63	4.2	71	4.5	0.94 (0.67–1.32)	0.70
Nonfatal myocardial infarction	47	3.4	37	2.4	1.39 (0.91–2.15)	0.13
Nonfatal stroke	33	2.3	29	1.9	1.21 (0.73–2.00)	0.45
Hospitalization with new-onset angina	42	3.0	39	2.6	1.15 (0.75–1.78)	0.52
Transient ischemic attack	9	0.6	4	0.3	2.36 (0.73–7.68)	0.15
Composite infectious events	148	12.4	174	14.3	0.87 (0.70–1.08)	0.20
Death from infection	39	2.6	28	1.8	1.46 (0.90–2.38)	0.12
Hospitalization for infection	135	11.3	170	13.9	0.81 (0.65–1.02)	0.07
Complications of dialysis						
Need for access revision	145	13.2	147	12.4	1.08 (0.85–1.35)	0.54
Access-site infection	47	3.4	50	3.5	0.99 (0.67–1.48)	0.97
Serious fluid or electrolyte disorder	146	13.2	175	15.0	0.88 (0.71–1.10)	0.26
Placement of temporary dialysis catheter	118	10.0	124	9.7	1.03 (0.80–1.32)	0.85
Death as a result of treatment withdrawal	24	1.6	22	1.4	1.17 (0.66–2.08)	0.60
Death from cancer	14	0.9	16	1.0	0.92 (0.45–1.89)	0.82
Death from another cause	12	0.8	18	1.1	0.72 (0.35–1.49)	0.37

# Conclusions

- Early start (vs. late start) dialysis does NOT:
  - Reduce mortality
  - Improve cardiac outcomes
  - Improve nutritional status
  - Decrease infections
  - Decrease hospitalisations
  - Improve quality of life
  - Reduce patient personal costs
  - Reduce costs to the health budget
- **Findings apply to all sub-groups analysed**
- Dialysis should not be started based on eGFR alone

# actual GFR at start

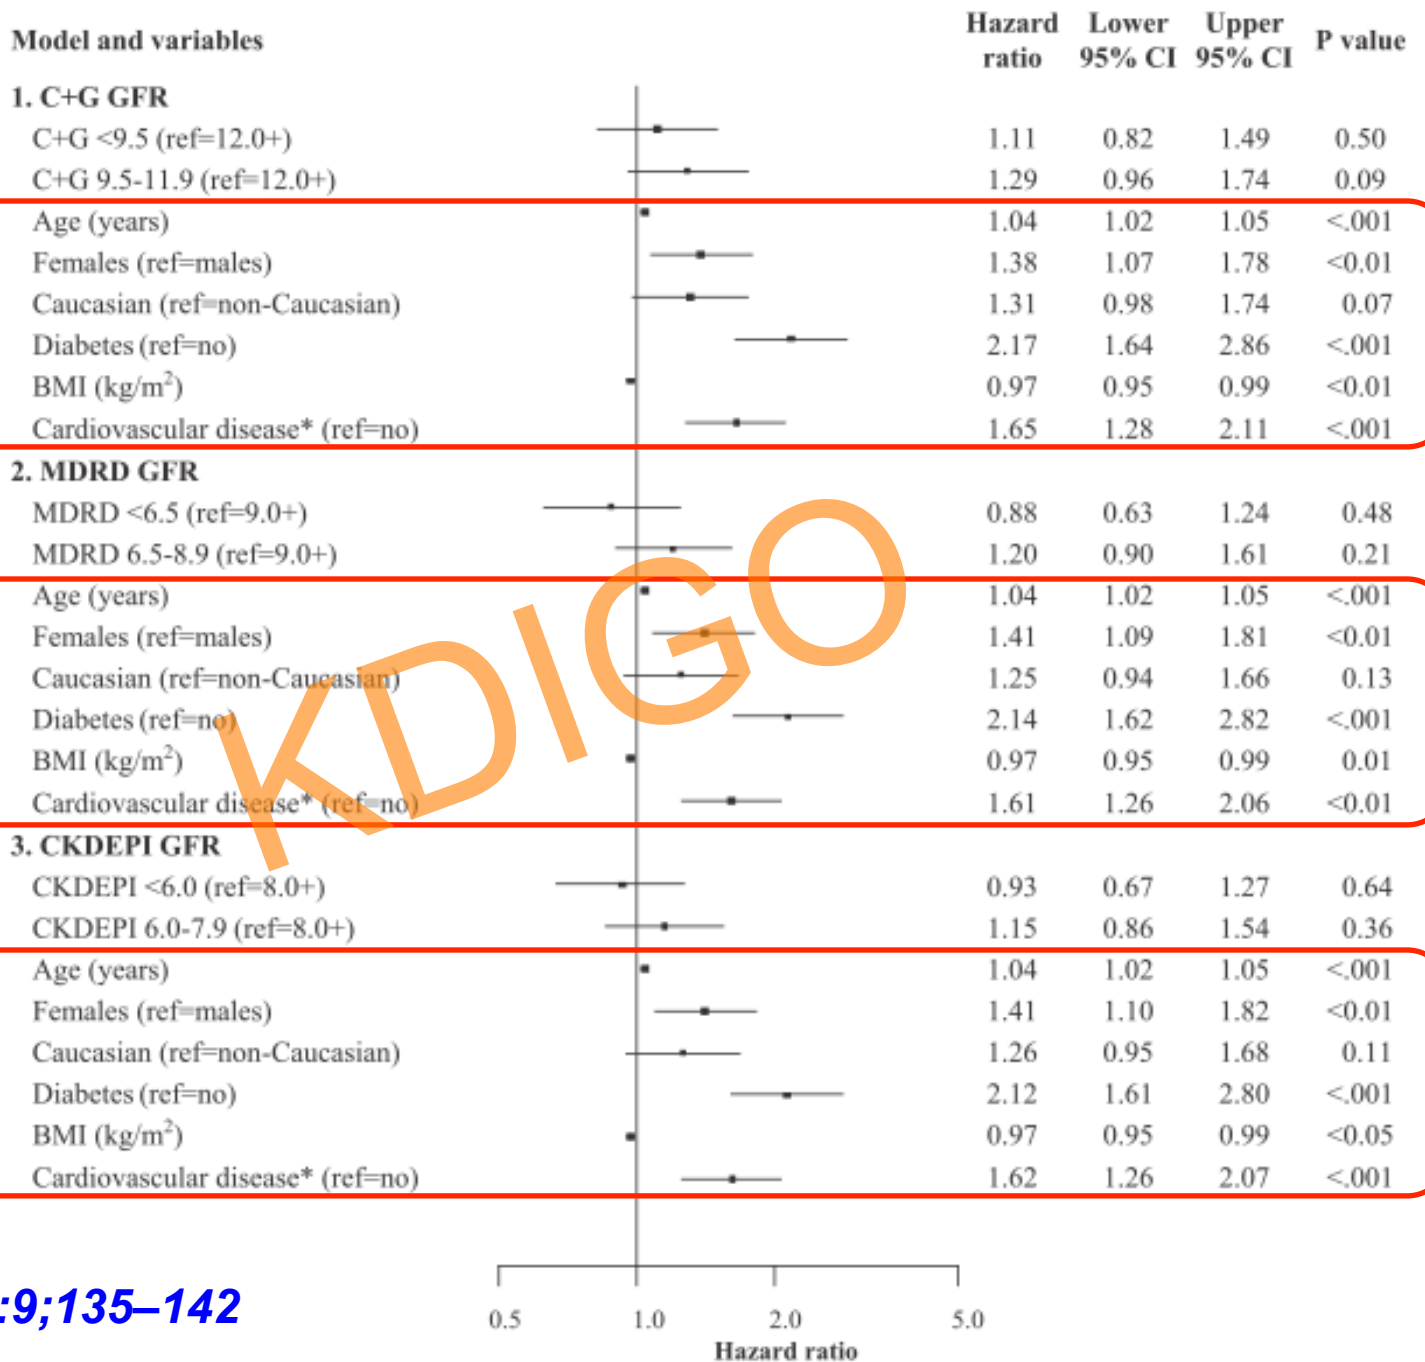

Number at risk	0	1	2	3	4	5	6	7
<9.5	248	234	210	172	127	76	41	25
9.5 – 11.9	256	236	201	148	107	62	35	16
≥ 12.0	264	240	204	167	124	72	40	21

Number at risk	0	1	2	3	4	5	6	7
<6.5	248	234	210	172	127	76	41	25
6.5 – 8.9	256	236	201	148	107	62	35	16
≥ 9.0	264	240	204	167	124	72	40	21

**CJASN 2014;9;135–142**

Significant difference for MDRD & CKD-EPI,  
but not with multivariate analysis

# Prognosis in subgroups

**age**  
**comorbidity**  
**rate of decline**  
**indication for dialysis**  
**nephrology care**  
**dialysis modality**

# Mortality risk in subgroups

# Mortality amongst older patients (>67 yrs) initiating dialysis 2006-2008; USRDS

\*Hazard ratios greater than 1 indicate greater mortality for early initiators relative to later initiators.

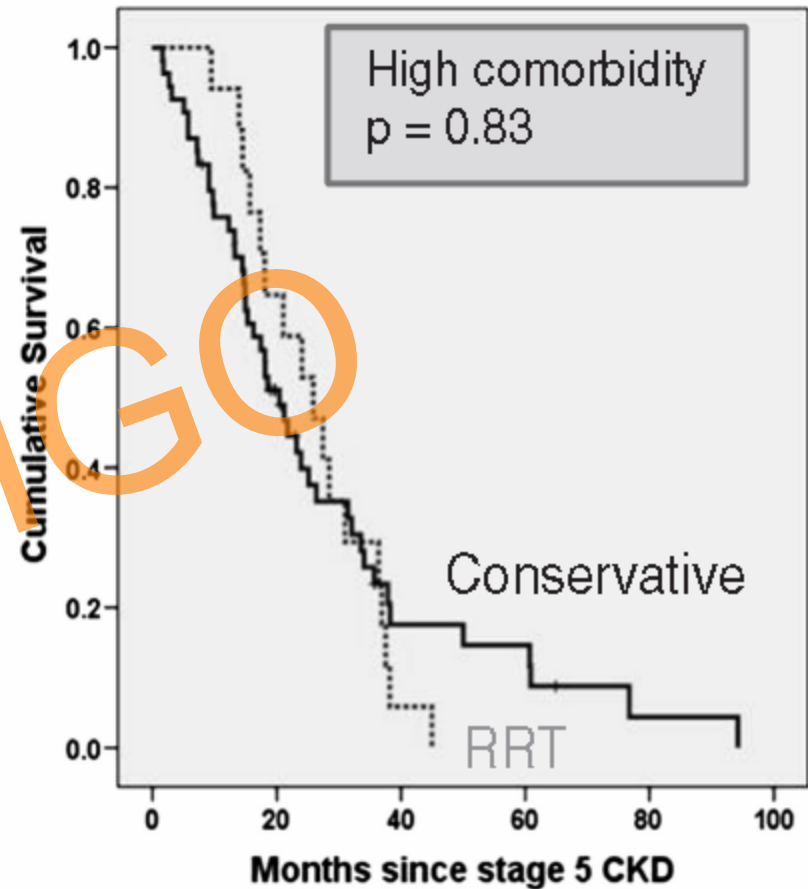

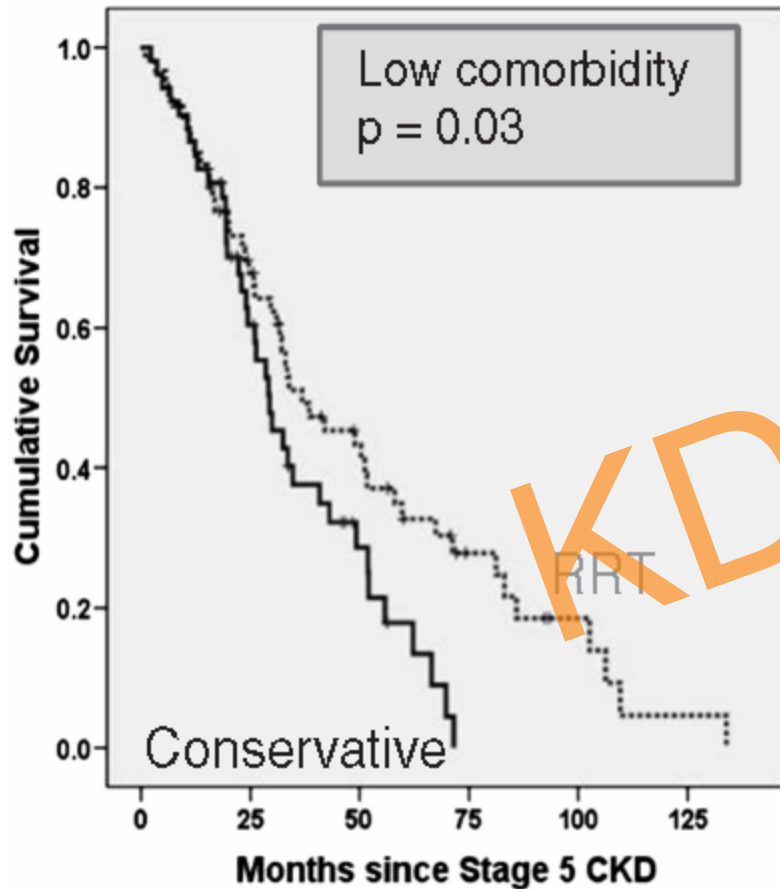

# RRT vs Conservative care for ESKD in the elderly

Source: Linked ANZDATA Registry, AIHW National Mortality Database and National Death Index.

End-stage kidney disease in Australia, AIHW June 2011

# Survival depends on co-morbidities

also age >75-80

# Functional status

Risk of death <3m of start

# Rate of decline is more important than absolute eGFR at dialysis initiation

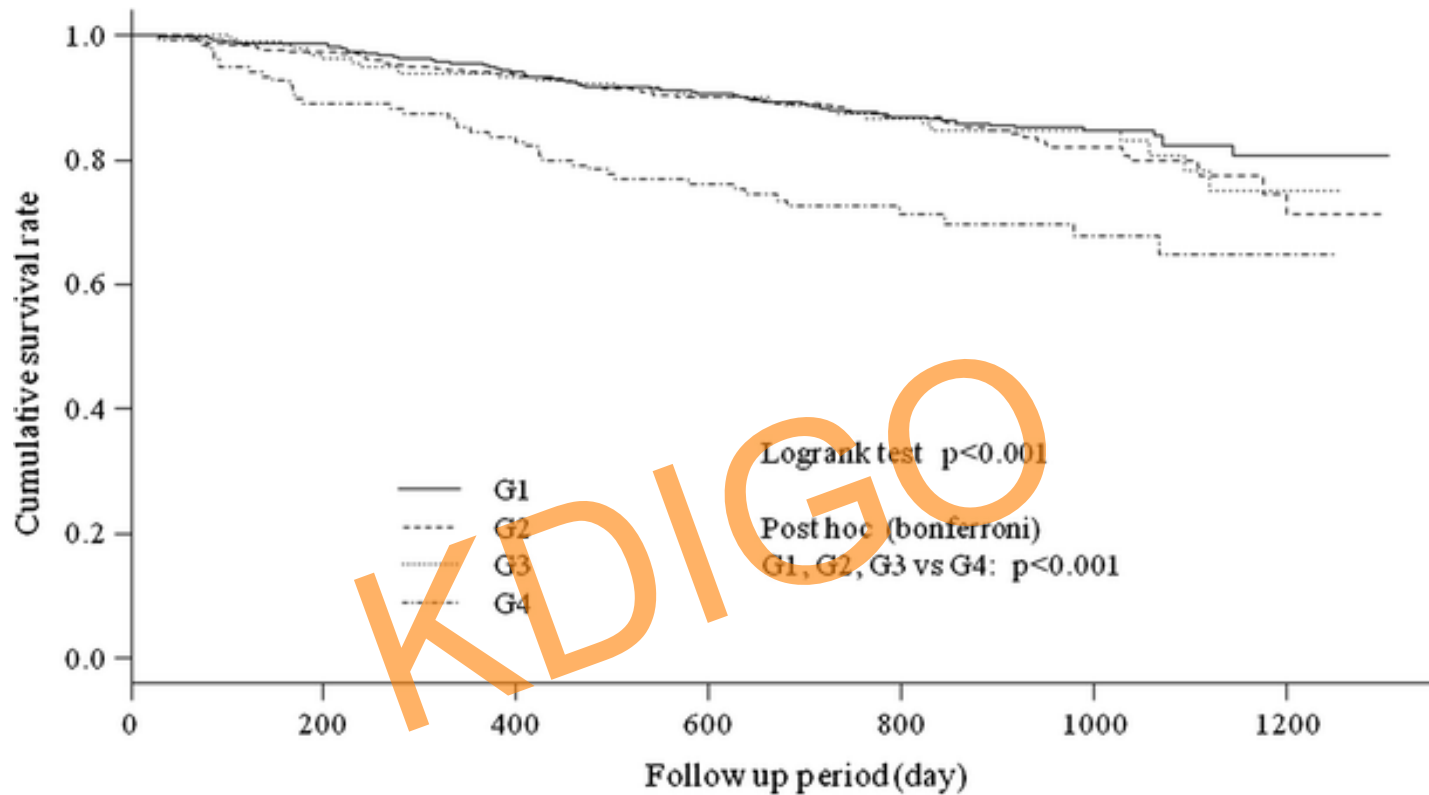

## eGFR decline rate tertiles (ml/min/m<sup>2</sup>)

	Slowest (n=105)	Intermediate (n=107)	Fastest (n=107)	P value
eGFR at RRT start	7.8 (6.2-10)	6.7 (5.3-8.1)	6.8 (5.2-8.5)	< 0.005
eGFR 12 mths prior to RRT	9.3 (7.7-12.1)	11.6 (10.5-14.2)	19.8 (15.8-29.5)	<0.001

# Rate of decline...cardiac symptoms

G1	555	543	515	463	294	154	30
G2	417	402	377	339	220	131	23
G3	183	174	167	154	99	56	10
G4	137	120	111	92	55	34	5

Higher rate of decline over 3m before start  
 → more cardiac symptoms at start  
 greater mortality, CV mortality

# Indication for dialysis

Greater mortality risk if dialysis commenced because of...

**volume overload or hypertension**

**VS**

**eGFR**

**uraemic symptoms**

**other or unknown**

**n =461 (437 HD)  
retrospective  
median F/U 2.4y**

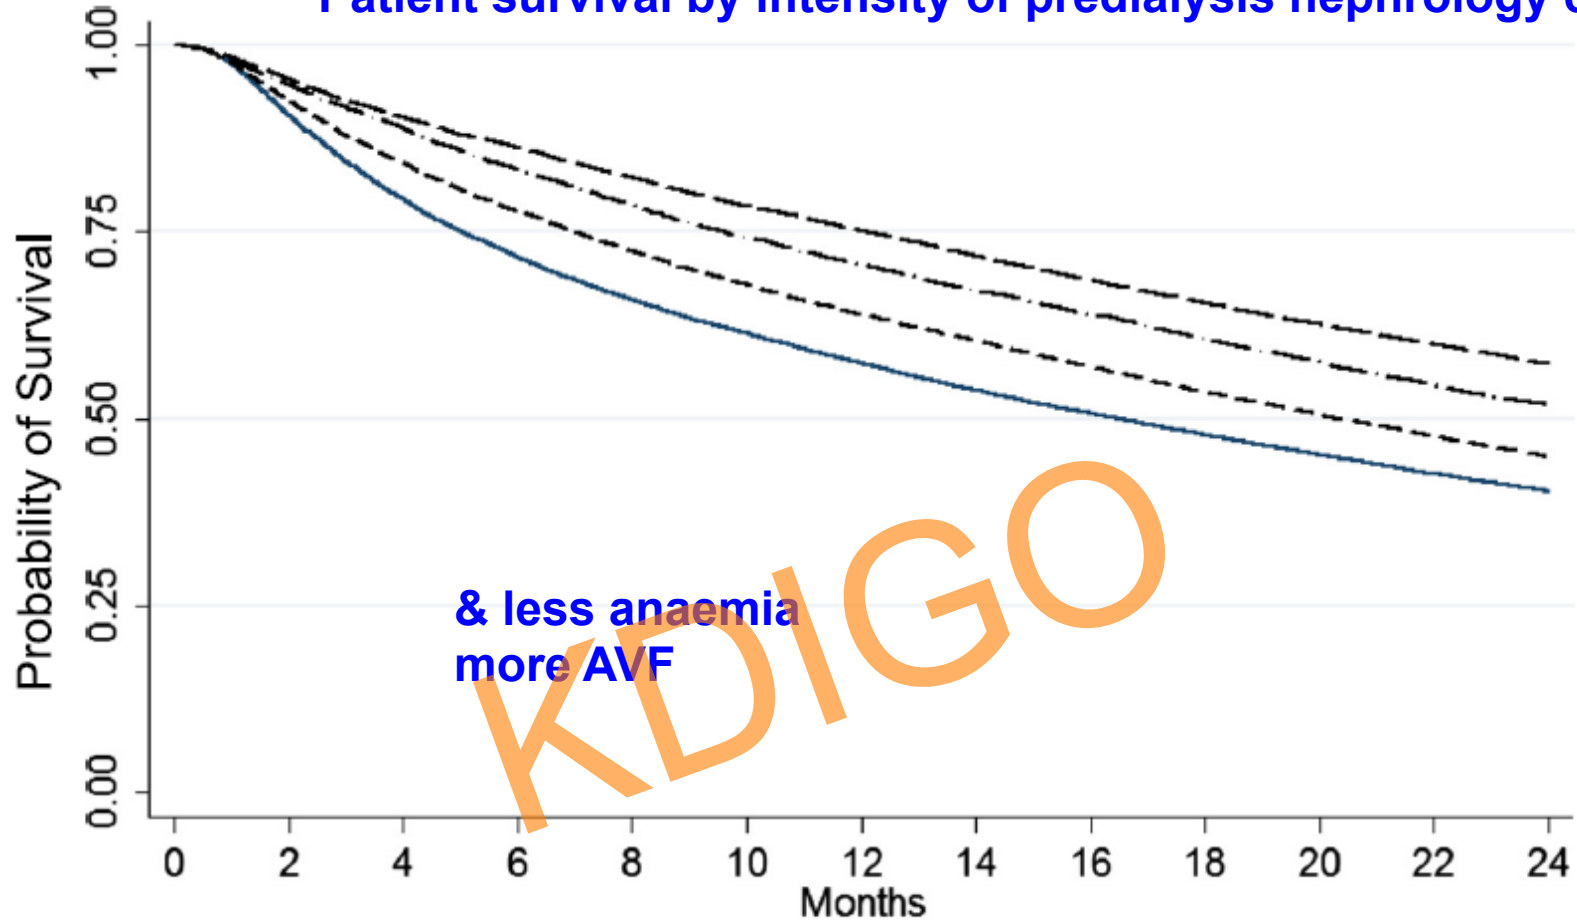

# Early start vs early referral

**DOPPS**  
**n = 8500**  
**HD**

symptoms attributable to another disease

age

primary disease

# Guidelines

2012

## 5.3: TIMING THE INITIATION OF RRT

5.3.1: We suggest that dialysis be initiated when one or more of the following are present: symptoms or signs attributable to kidney failure (serositis, acid-base or electrolyte abnormalities, pruritus); inability to control volume status or blood pressure; a progressive deterioration in nutritional status refractory to dietary intervention; or cognitive impairment. This often but not invariably occurs in the GFR range between 5 and 10 ml/min/1.73 m<sup>2</sup>. (2B)

**Intent-to-defer**

KDIGO

# GFR “protocol violations”

Reason for not starting dialysis in assigned GFR range (protocol violations)	Randomized to early start group but started with GFR < 10ml/min/1.73m <sup>2</sup> (n=75)	Randomized to late start group but started with GFR >7ml/min/1.73m <sup>2</sup> (n=322)
Uremia	5	234
Physician discretion	10	25
Fluid overload	1	28
Delay in access creation	21	1
Patient refusal	13	3
Unavailability of resources	6	6
Delayed follow up	6	.
Sudden unexpected decline in GFR	6	.
Malnutrition	.	5
Hyperkalaemia	.	4
Malaise and fatigue	.	3
Sudden unexpected improvement in GFR	.	2
Other reasons*	7	11

# Symptoms at dialysis initiation

**TABLE 3.** *Symptom at dialysis initiation*

Symptom	%	Median age		%Male	Underlying renal disease (%DMN)
		Years	Range		
Nausea, appetite loss	46.3%	60	18-98	57.3%	27.7%
Congestive heart failure	19.8%	64	18-99	52.5%	40.5%
Intractable edema	6.1%	61	18-88	56.4%	49.7%
Oliguria	4.5%	62	20-90	60.9%	19.9%
Neuropathy	7.1%	57	21-88	62.5%	27.8%
Unrecovered acute exacerbation of renal function	1.8%	64	18-90	53.3%	17.8%
Other uremic symptom	5.5%	70	26-93	61.4%	33.6%
No symptom	8.8%	58	18-88	65.4%	20.6%

# Late-start IDEAL = intention to defer

## Predicting risk of starting dialysis early

<b>Age*</b>		<b>0.98</b>	<b>0.97</b>	<b>0.99</b>
<b>Sex female*</b>		1.15	0.93	1.42
<b>Whites</b>		<b>0.79</b>	<b>0.63</b>	<b>0.99</b>
<b>Smoking</b>	Current	0.84	0.60	1.17
	Former	1.13	0.91	1.41
	Never	1.00	1.00	1.00
<b>Comorbidities</b>	Diabetes	<b>1.51</b>	<b>1.23</b>	<b>1.86</b>
	IHD	<b>1.28</b>	<b>1.00</b>	<b>1.63</b>
	Hyperlipidemia	0.87	0.70	1.07
<b>Cause of ESRF</b>	Diabetes	<b>1.54</b>	<b>1.24</b>	<b>1.90</b>
	Glomerulonephritis	1.19	0.90	1.56
	Polycystic Kidney Dise	0.92	0.67	1.25

**younger, non-white, diabetes, ischaemic heart disease**

## Risks of intent-to-defer

Impact on the ability to train & remain on home-based therapy

Accumulation of comorbidities

- General ill health
- Access creation problems if delayed placement

# Home-based therapy uptake

	Home HD and PD	Non-home therapy
Early	156	129
Late	144	152

**P=0.16**

# Patient Survival – Home dialysis

# Treatment Survival – Home dialysis

## Temporary dialysis catheter usage in the IDEAL trial at the first dialysis treatment:

15 early-start patients (3.7%)

35 late-start patients (8.3%)

**(Don't forget access creation!)**

## Conclusions: Intent-to-defer

Some patients will need close supervision:

**diabetes**

**ischaemic heart disease**

**high risk racial groups**

Some patients should do well:

**older**

**few comorbidities**

# Is an age specific approach to dialysis initiation warranted?

Functional status, co-morbidity, frailty and falls risk, ability to self transfer

Co-morbidity – IHD, PVD, dementia, poor nutritional status

“Would I be surprised if this person died in the next 12 months?”

Early referral important to gauge rate of decline and functional trajectory

KDIGO
