Managing Your Adult Patients Who Have a KIDNEY TRANSPLANT

Implications for PRIMARY CARE in:
- Kidney Transplant Recipients and Chronic Kidney Disease
- Immunosuppressive Medications
- Managing Adverse Events
- Long Term Care
  - Acute Rejection and Kidney Malignancy Detection
  - Cardiovascular Disease Risk Reduction
  - Non-Cheast Diabetes After Transplant
- Medications
- Cancer
- Other Complications

The latest version of the KDIGO Clinical Practice Guidelines for the Care of Kidney Transplant Recipients is available at: www.kdigo.org

ESRD Risk Tool for Kidney Donor Candidates

<table>
<thead>
<tr>
<th>Proportion of ESRD Incidence in End-Stage Renal Disease:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pre-Donation 15-Year*</td>
</tr>
<tr>
<td>Post-Donation 15-Year*</td>
</tr>
</tbody>
</table>

The pre-donation risks represent a projection if a person does not donate a kidney. Details about estimating post-donation risk are provided below.

Patient Characteristics:

- Age (years): 42
- Gender: Female
- Race (white or other): White
- eGFR (mL/min/1.73m²): 90
- Systolic Blood Pressure (mmHg): 120
- Hypertension Medication: No Medication
- BMI (kg/m²): 25
- Non-Insulin Dependent Diabetes: No Diabetes
- Urine Albumin to Creatinine (mg/g): 4
- Smoking History: Non-Smoker
