The prevalence of undiagnosed CKD in type 2 diabetes has been decreasing, but is still over 50% in patients with CKD stage G3a

Percentage of undiagnosed CKD cases in T2D patients¹

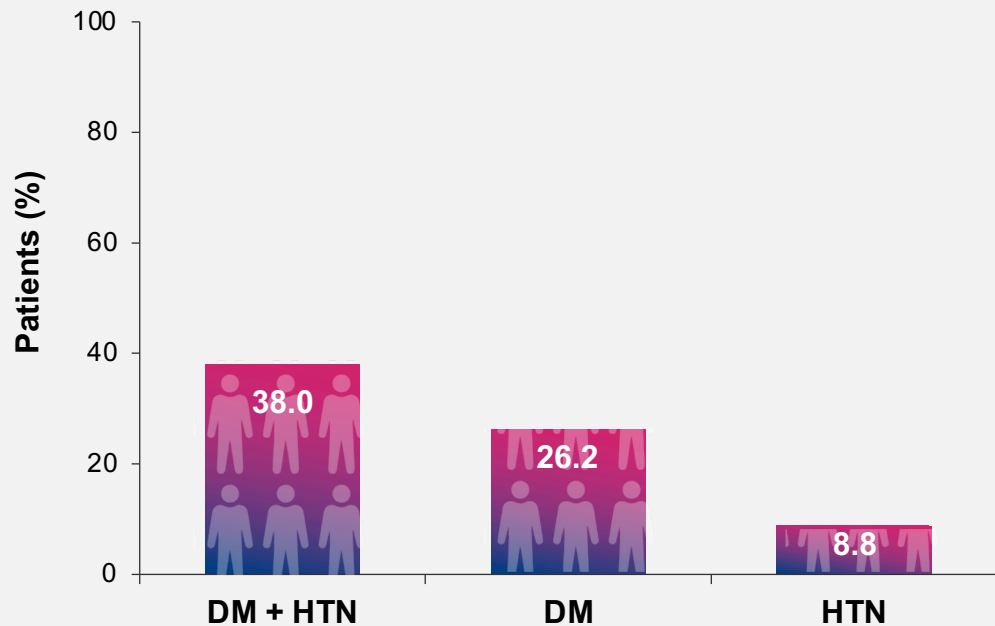

In the UK, only 39.5% of patients with microalbuminuria had a code for microalbuminuria on their record²

^aThe index date for CKD stage was the first serum creatinine measurement leading to an eGFR <60 mL/min/1.73 m²
 eGFR, estimated glomerular filtration rate
 1. Bakris GF, et al. Presented at the National Kidney Foundation 2019 Spring Clinical Meetings; May 8th–12th, 2019; Boston, MA, USA; Poster 308; 2. Willis A, et al. *Diabetes Care* 2020.
 doi:10.2337/dc19-2243 [Epub ahead of print]

Despite universal recommendations, screening of at-risk individuals is inadequate, which may contribute to the lack of diagnosis of CKD stage 3

Percentage of at-risk patients adequately tested^{1,a,b}

Prevalence of diagnosed and undiagnosed CKD cases in patients with CKD stage 3

^aAt-risk patients defined as having a diagnosis of diabetes or high blood pressure; ^bAdequate CKD screening defined as presence of test results for eGFR and urine albumin:creatinine ratio each year. This study shows the frequency of guideline-recommended CKD screening among patients at risk in a retrospective data set from a US clinical laboratory to identify where education efforts may be needed; ^cFrom a chart review on a random sample of 102 patients selected from the 6895 patients with eGFR <60 mL/min/1.73 m² in Rochester, NY, USA between 2003–2004. Of the 102 patients sampled, 85 patients had CKD stage 3: 12 with a confirmed diagnosis and 73 with an unconfirmed diagnosis; ^d39,525 patients with serum creatinine measurements from the Italian hypertensive population followed up by family practitioners in 2005; ^eBased on a cohort of 206,036 Medicare beneficiaries, of which 79,649 had lab-identified CKD stage 3 with 2+ qualifying lab results ≥90 days apart indicating CKD, between 2010 and 2011; ^f23,614 patients from the Explorys Linked Claims-EMR Data database with two consecutive eGFR readings indicating CKD stage 3 >90 to ≤730 days apart (2015–2020); ^g250,879 patients from TriNetX, a global federated research network providing statistics on electronic health records, with two consecutive eGFR readings indicating CKD stage 3, >90 to ≤730 days apart (2015–2020)

- Summary

Effects of an Electronic Software “Prompt” With Health Care Professional Training on CV and Renal Complications (GP-Prompt Study)

2,721 patients
2 years of FU

Prespecified
outcomes

- TC <4.0 mmol
- Coding for microalbuminuria
- Increased with intensive intervention vs with control.

Microalbuminuria with T2D identifies an increased risk of cardiorenal complications.

Tight & targeted control of modifiable CV risk factors can reduce CV complications & mortality, although it remains therapeutic inertia in identifying and treating these high-risk patients.

Improvements in lipid profile and coding MA can benefit patients with diabetes to alter the high risk of atherosclerotic CV events.

Association of continuity of primary care & outcomes in people with CKD

86,475 people with CKD

Level of continuity	HIGH (51.3%)	MODERATE (30.0%)	POOR (18.7%)
OUTCOMES			-
All cause hospitalisation	1.0	1.28 (1.25-1.32)	1.52 (1.47-1.57)
All cause ED visits	1.0	1.42 (1.39-1.46)	1.78 (1.73-1.83)
RAAS inhibitors prescribed	1.0	0.99 (0.96-1.02)	1.03 (0.98-1.07)
Statins prescribed	1.0	0.89 (0.84-0.95)	0.8 (0.74-0.86)

Barriers & solutions to the uptake SGLT-2 inhibitors in clinical practice

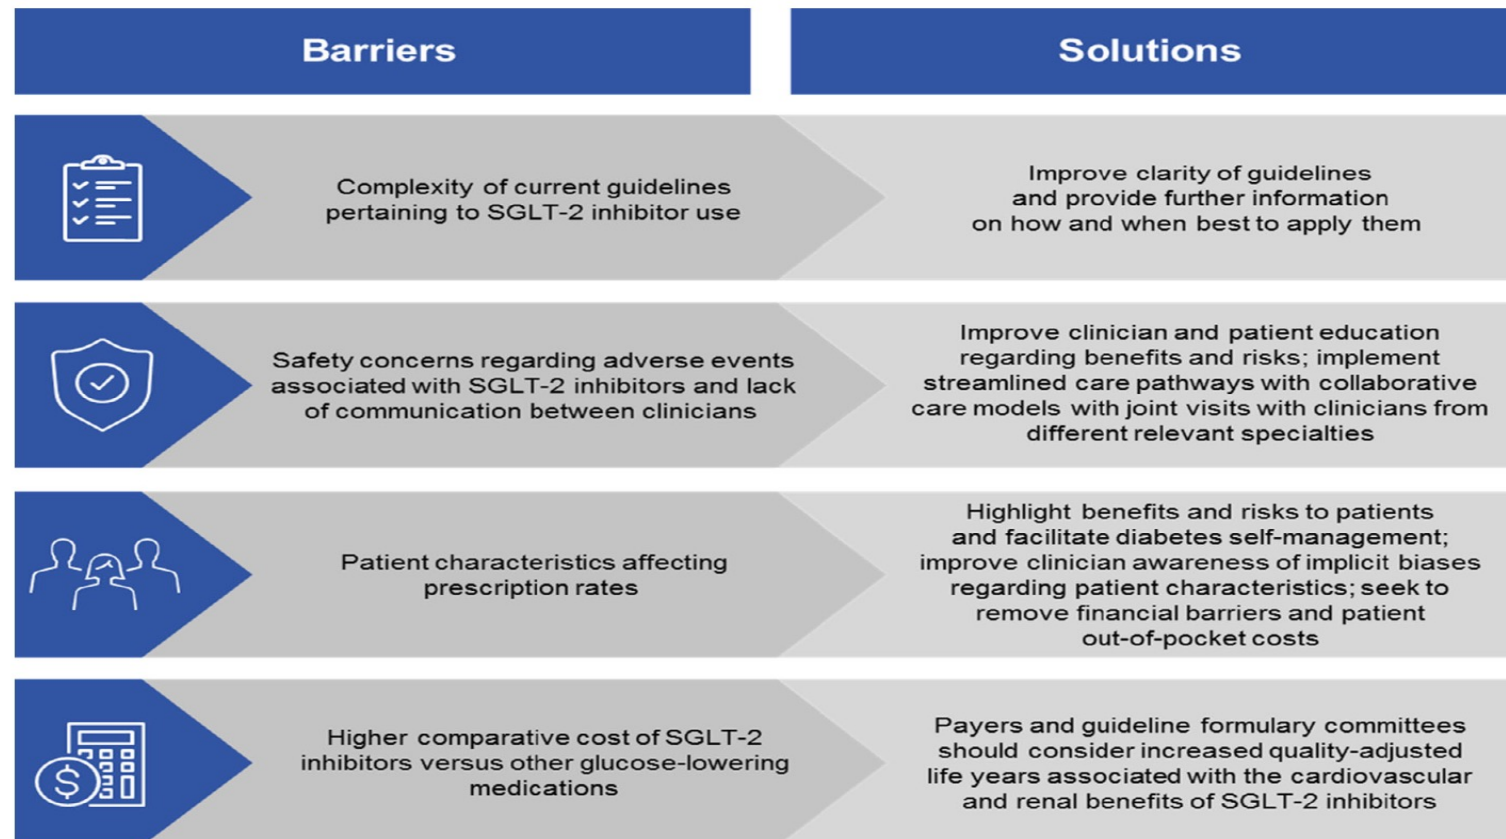

FIGURE 5 A summary of barriers to the uptake of sodium-glucose co-transporter-2 (SGLT-2) inhibitors in clinical practice and proposed solutions

Influence of early referral to a nephrologist on kidney function decline in patients with diabetes and CKD

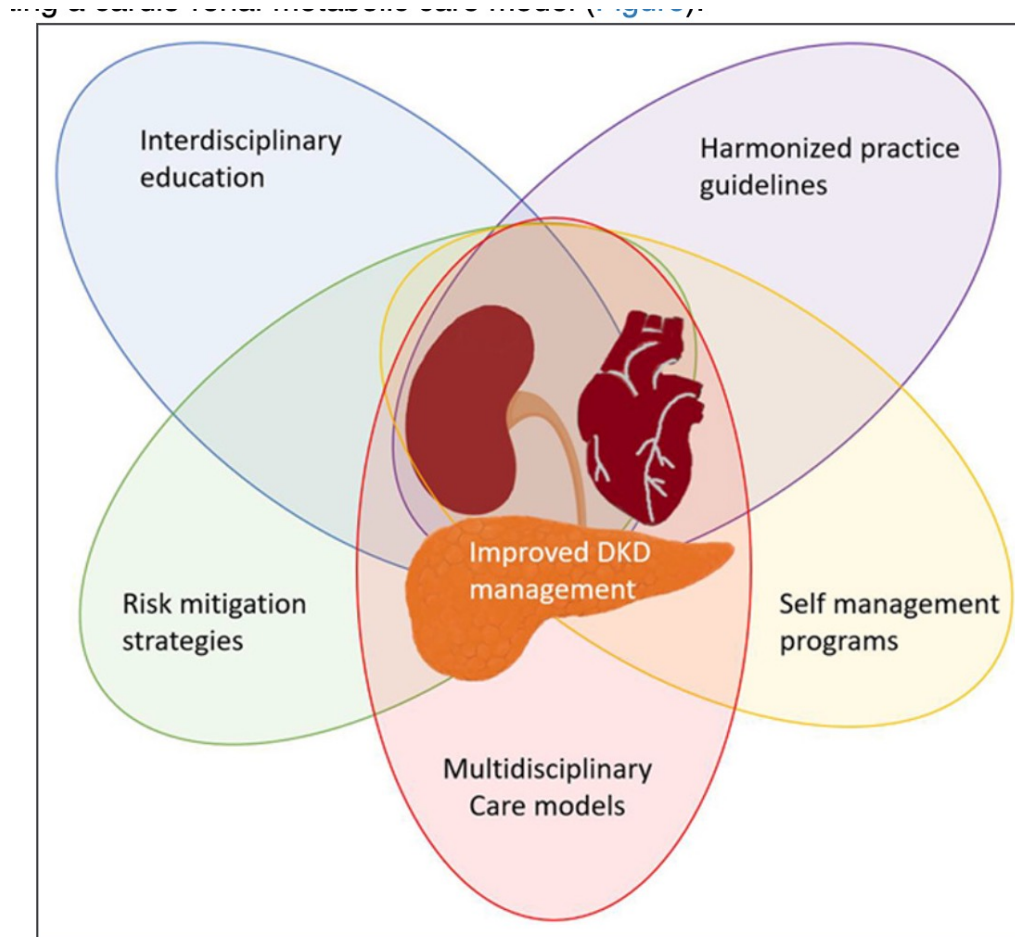

Better blood pressure control, slower eGFR decline, higher use of RAASi as well as less use of NSAIDs in CKD patients when treated by nephrologists

	Nephrologist care		PCP care	
	Baseline	Final	Baseline	Final
n/o patients	52		65	
Age	62.5 ± 9.3		62.8 ± 9.9	
Duration of diabetes	14.7 ± 8.4		14.2 ± 8.0	
Duration of hypertension	10.6 ± 9.9		10.3 ± 8.8	
sysBP	140 ± 30	130 ± 21	140 ± 19	145 ± 23
diaBP	76 ± 14	70 ± 10	79 ± 8	77 ± 11
Albuminuria	158 (62-451)	216 (97-619)	109 (50-509)	389 (92-728)
eGFR	83.8 ± 26.1	80.4 ± 35.5	78.6 ± 28.1	66.6 ± 29.9
Use of ACEs	25 (48)	44 (90)	35 (53)	37 (70)
Use ARBs	1 (2)	22 (45)	0 (0)	2 (4)
Use of Statins	2 (4)	21 (43)	10 (16)	5 (9)
Use of NSAIDs	6 (11)	0 (0)	3 (5)	17 (32)

ACE, aniotensin-converting-enzyme; ARB, angiotensin-receptor-blocker, CKD, chronic kidney disease; eGFR, estimated glomerular filtration rate; NSAID, non-steroidal antiinflammatory drug; RAASi, renin-angiotensin-aldosterone system inhibitor

Components of a successful cardio-renal-metabolic care model at an institutional level

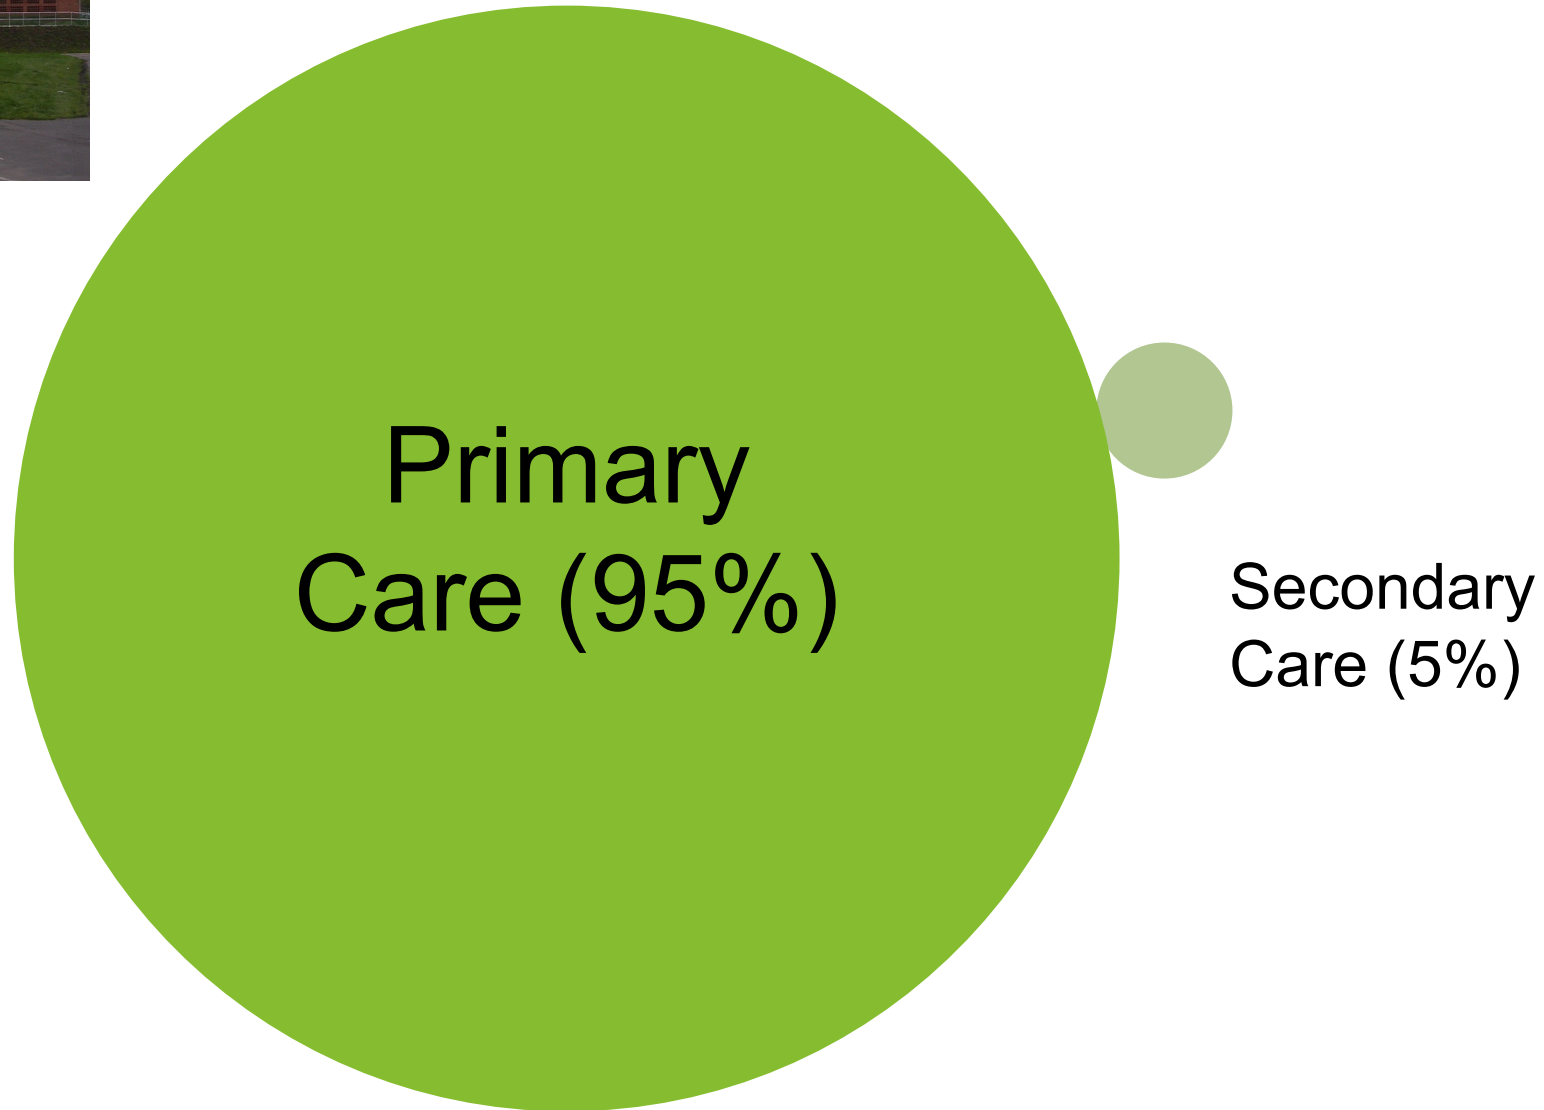

Learning from models of care for diabetes: Delivery of primary care 1990s

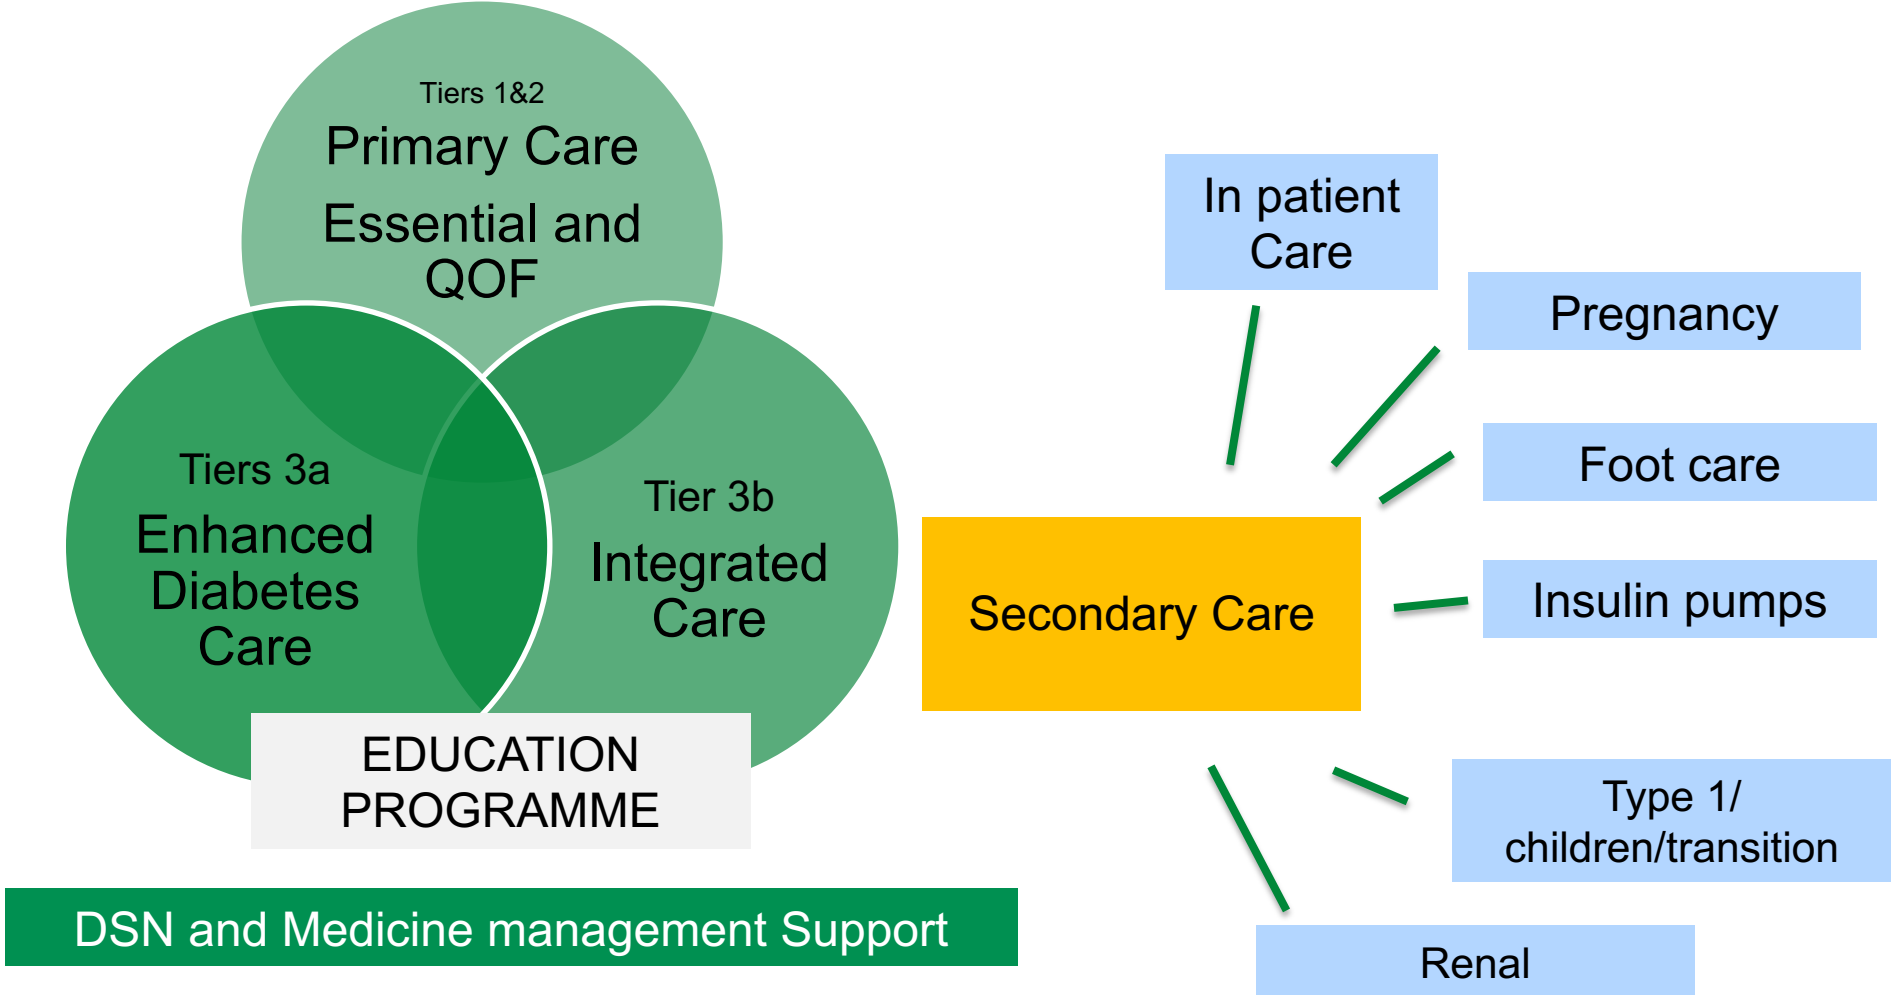

Delivery of primary care 2023

Leicester Commissioning Pathway: Super Six and Necessary Nine!

Model of care is safe and cost-effective

Clinical outcomes from the RCT. [7]

Outcome	Mean difference (95% CI)	p-value
Non-elective bed days		
Diabetes as a primary diagnosis	2.20 (-0.92, 5.32)	0.14
Diabetes as a primary or secondary diagnosis	2.78 (-2.71, 8.27)	0.27
First outpatient attendance	0.02 (-0.47, 0.52)	0.92
Admissions with type 2 diabetes complications	0.30 (-0.85, 1.45)	0.55

Cost per person/year in core practices

£255 (95% CI 175, 380)

Cost per person/year in enhanced practices

£173 (95% CI 96, 291)

Annual saving per patient

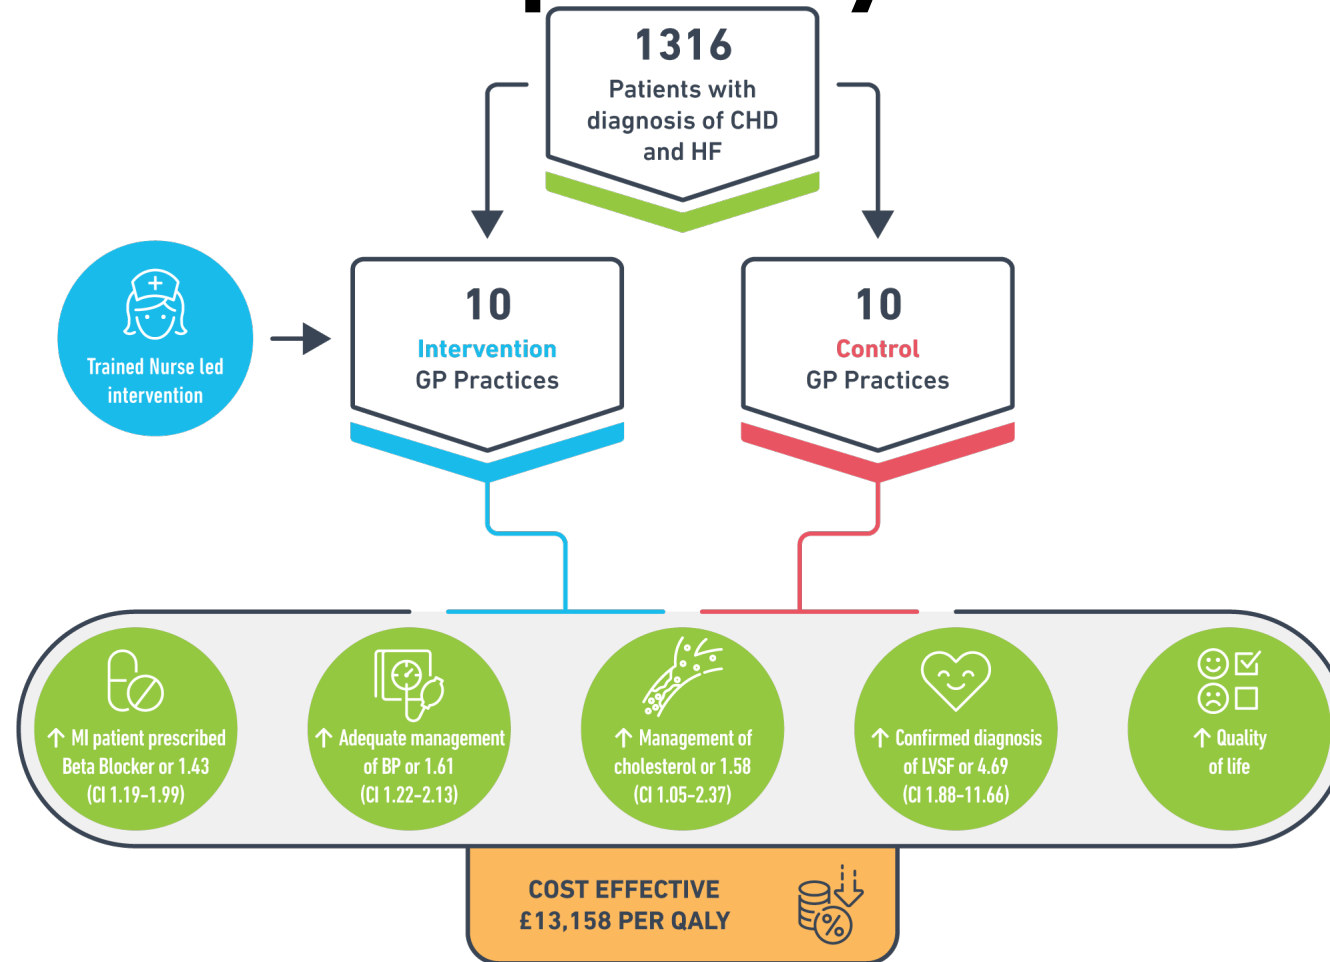

-£83 (95% CrI -148,-28)

Savings if rolled out in UK

**-£276,200,000
(95% CI -495,400,000, -94,480,000).**

Disease management program of heart failure in primary care

Significantly more patients in the intervention group with unconfirmed diagnosis of HF had improved outcomes

Collaborative care approach: Primary care, cardiology, nephrology, endocrinology

GPs and specialists must end the “them and us” divide

Clare Gerada used her final speech as chairwoman of the RCGP to call for GPs and specialists to work together to improve continuity of patient care, as **Tom Moberly** reports

GPs and hospital doctors will have to change the way they work together if the health service is to improve continuity of care for patients, Clare Gerada believes.

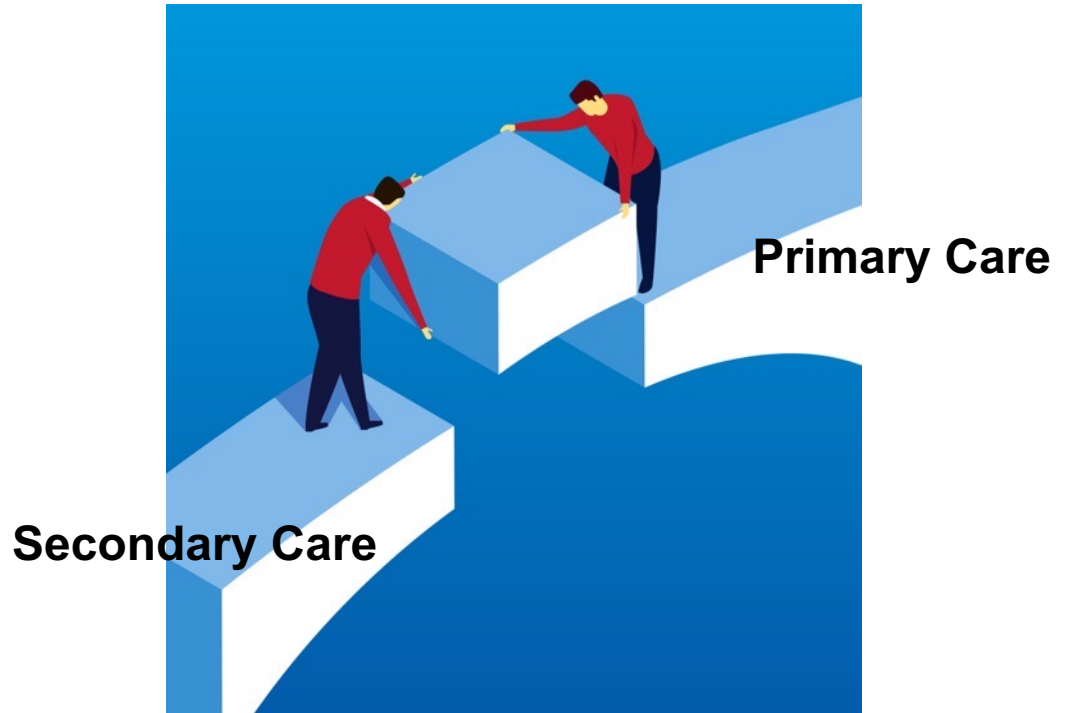

Giving her final speech as chairwoman of the Royal College of General Practitioners at the college's annual conference in Harrogate last week, Gerada said that the “them and us” divide between GPs and hospital

specialists had to end. She also

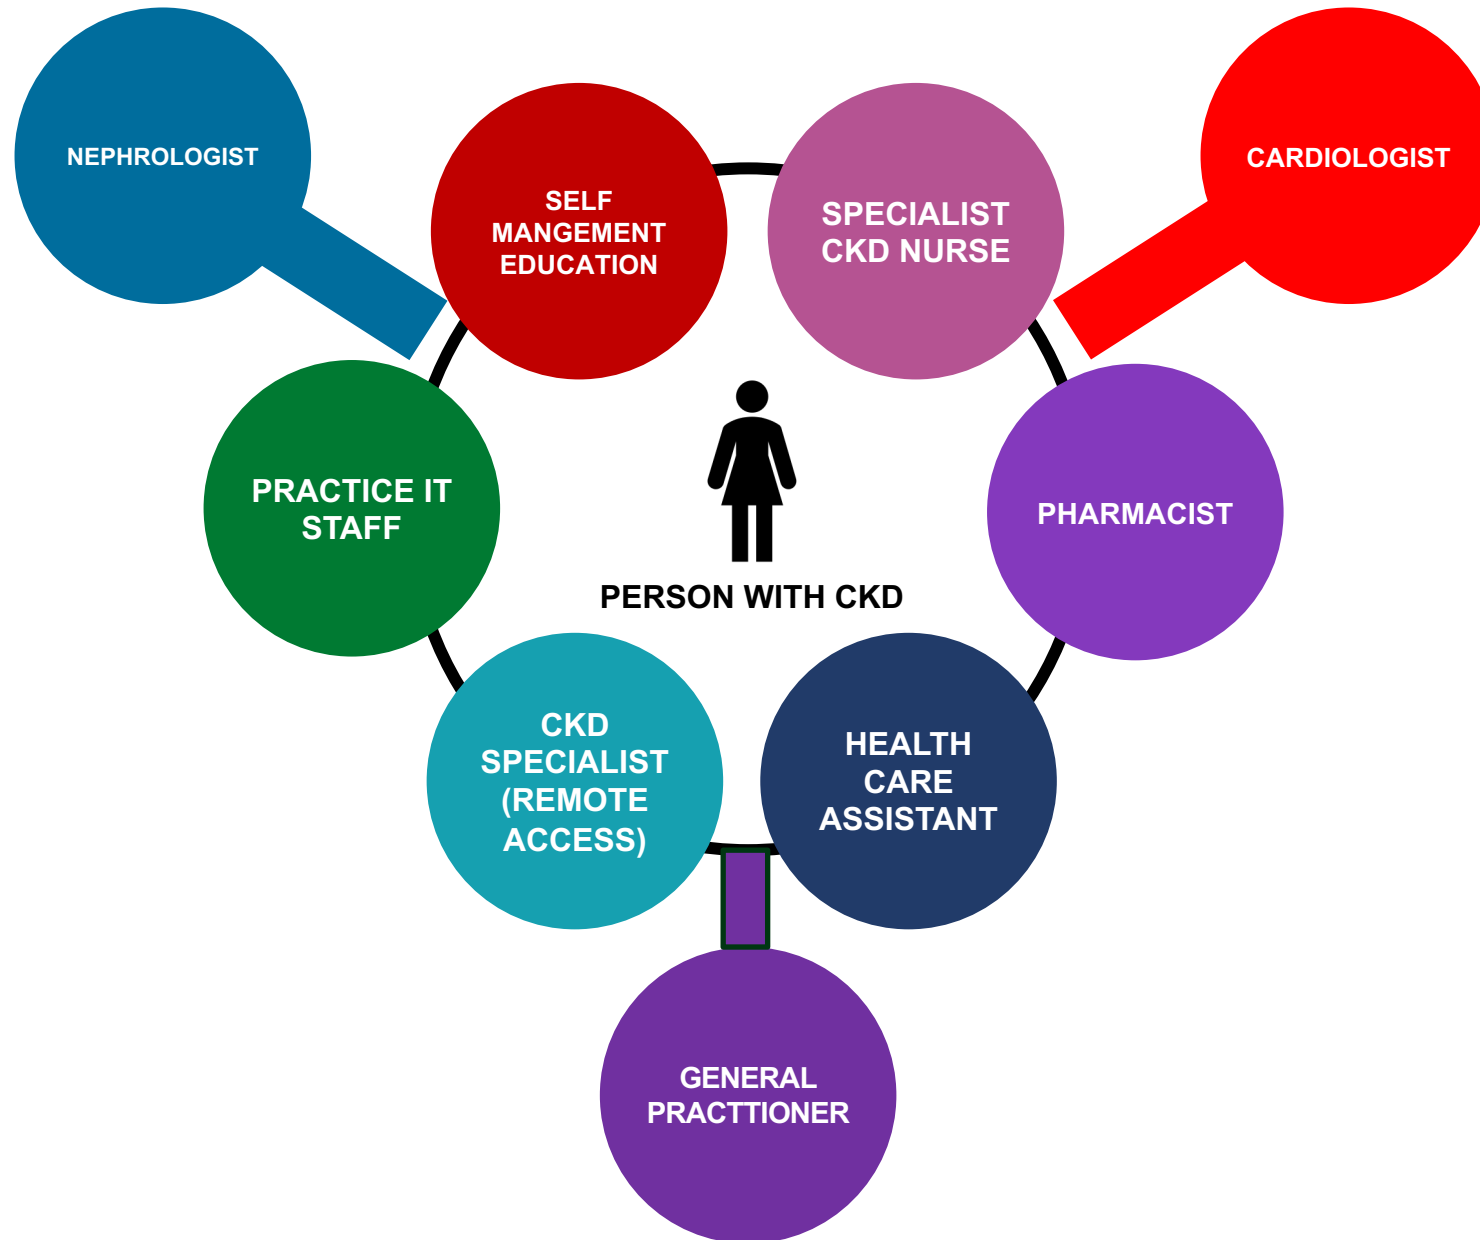

entrance, will become a thing of the past,” she said. “In future, we will be working together in one integrated system of care.” She argued that all providers of health and social care services within a particular geographical area should pool resources, with primary, community, social, and acute care funding merged into one budget. This would, she argued, allow real integration

One of the things that must change is our relationship with our specialist colleagues

about pilot schemes to extend general practices' opening hours. Hunt spoke of his far reaching vision for general practice moving from “reactive to proactive” service delivery. “I hope that history will judge me to be

Integrated multidisciplinary model of care for CKD

Outline

- Unmet need in CKD
- Evidence for CKD and CVD prevention
- Barriers to CKD Care
- Potential solution – CKD Model of Care
- **Summary**

Integrated care: the key to management of CKD

- Patient engagement, education and activation
 - Use of new technologies?
- Education of health care professionals
 - Breakdown of specialty barriers
 - Integration of medical workforce training
- New ways of working
 - Virtual clinics
 - New specialties (cardiorenaldiabetologist...?)
 - Primary care-based specialists?

Summary

- GPs/PCPs function as gatekeepers in the area of chronic diseases
- A greater emphasis on detecting CKD and management in primary care
- Management of CKD patients in primary care is complex and is influenced by physician-bound considerations related to individual knowledge and perception of the importance of CKD
- Strategies are needed to improve GPs/PCPs understanding of the concept of CKD by education, innovative interventions and integrated care programmes
